

Intelligent Assembly and Disassembly (IAD 98) (IFAC Proceedings Volumes)

Rapid development observed in modern production is firmly connected with the development of new assembly and disassembly systems. In small batch production, where fast changes of products and short development times of new products are demanded, development of reliable, fast-adaptable and self-teaching assembly systems can be observed. Important fields of product development such as product design, development of planning systems, simulation and modelling, logistics, mechatronics and sensors, development of new assembly system components as well as collecting and processing of knowledge are essential for the development of new intelligent assembly systems (IAS). The aim of this colloquium specialised on IAD is to highlight this topic, show the actual results of the research and development work, set the direction of future development and analyse the possibilities of introducing of IAD into the production process. Papers, presented at the workshop, showed that the disassembly process and disassembly systems are becoming more and more important in the product life cycle and in the national economy. Some topical issues in disassembly, for example the environment legislation, the product as well as part recycling properties, disassembly tools and system development were discussed.
